Room Title: Incident Response Fundamentals

Link: <https://tryhackme.com/room/incidentresponsefundamentals>

Focus Area: Hash Cracking

Executive Summary

Completed the **Incident Response Fundamentals** room on TryHackMe, learning about the process and requirements for fast incident response. The room covered what incidents, types of incidents, the incident response process, techniques, and an exercise showing a phishing campaign.

Learning Objective

- Relearn incident response fundamentals
 - Become more familiar with language regarding incident response
-

Tools & Technologies Used

Category	Tools/Technologies
N/A	N/A

Walkthrough

Task 1: Introduction

Task 2: Discuss what incidents are and whether incidents are false positives or true positives. Different processes may initiate investigations to determine whether an incident requires a quarantine response.

Task 3: Discusses types of incidents, including malware infections, security breaches, data leaks, insider attacks, and DoS attacks. There are lots of different types of incidents and being able to determine which one your alert system has detected can impact the response time and process needed.

Task 4: This discusses the phases of incident response: Preparation, Identification, Containment, Eradication, Recovery, and Lessons learned. NIST defines the phases: Preparation; Detection and Analysis; Containment, Eradication, and Recovery; and Post Incident Activity.

Task 5: There are a lot of Incident Response Techniques. Some of the more common are the use of a SIEM (Security Information and Event Management), Anti-Virus, EDR(Endpoint Detection and Response). Most companies also have a playbook for incident response to allow for quick, efficient responses and documentation.

Task 6: This is a simulation of a phishing campaign, downloading malware via email attachment. This simulation focuses on the full incident response process.

Task 7: Conclusion
