Room Title: SOC L1 Alert Triage

Link: <https://tryhackme.com/room/socl1alertrriage>

Focus Area: Responding to SOC alerts

Executive Summary

This TryHackMe room, **SOC L1 Alert Triage**, provides hands-on training in the fundamental responsibilities of a Level 1 Security Operations Center (SOC) analyst. The module focuses on efficiently identifying, prioritizing, and responding to security alerts within a realistic SOC environment.

Key learning outcomes include:

- Understanding SOC alert structure, including critical fields such as timestamp, alert name, severity, status, and description.
- Mastering alert filtering techniques (primarily by time and severity) to focus on the highest-priority threats.
- Practicing structured alert triage by analyzing real-world scenarios, distinguishing between true positives and false positives, and applying appropriate response actions.

During the exercise, three sample alerts were triaged: a suspicious double file extension (.mp4.exe), a potential data exfiltration attempt, and a download from GitHub. The double-extension alert was identified as the sole true positive, highlighting the importance of recognizing common evasion techniques. All alerts were successfully investigated and resolved according to standard SOC workflows, demonstrating effective initial response procedures.

The room effectively builds foundational triage skills essential for junior SOC analysts, emphasizing speed, accuracy, and proper alert classification to minimize risk and support higher-tier analysts. Completion of this module strengthens practical readiness for real-world SOC operations.

Learning Objective

- Familiarise with the concept of SOC alert
 - Explore alert fields, statuses, and classification
 - Learn how to perform alert triage as an L1 analyst
 - Practice with real alerts and SOC workflows
-

Walkthrough

Task 1: Introduction

Task 2: Open the SOC webpage and identify the alerts that you will be working on. SOC analysts must be able to work efficiently in their environments, identifying which threats are the highest priority. SOC analysts use SIEM, SOAR, EDR, ITSM, and many other systems for triaging.

Task 3: Alerts have many different fields to help format information about the event. Time, name, severity, status, and description are some of the most important categories that let us plan our initial response.

Task 4: You can filter alerts in many different ways. The two most popular are by time and severity. An alert that hasn't been responded to quickly has a greater chance of causing more damage. An alert with a higher severity has a higher potential for impact if it is a True Positive.

Task 5: This task consisted of reading three alerts, a double extension file, a possible data extraction, and a download from Github. The only true positive alert was the double file extension, which was a .mp4.exe alert. After resolving these alerts, they gave us flags to answer the questions.

Task 6: Conclusion

TryHackMe SIEM

Restart

Search for an alert

Name ↑↓	Severity ↑↓	Status ↑↓	Verdict ↑↓	Assignee	Actions
Double-Extension File Creation	High	Closed	True Positive	You (L1)	edit up
Potential Data Exfiltration	Critical	Closed	False Positive	You (L1)	edit up
Download from GitHub Repository	Low	Closed	False Positive	You (L1)	edit up
Unusual VPN Login Location	Medium	Closed	False Positive	T.Ross (L1)	edit up
Bruteforce Attack from External	Medium	Closed	True Positive	J.Adams (L2)	edit up
